

ABSTRACT OF THE DISCLOSURE

A connector for an optical transmitting and receiving device includes a housing, an assembly part, a cover and a spring. Between the cover and the assembly part is provided a positioning device for positioning the cover. The 5 housing is reverse "U"-shaped so as to form an open mouth, and thus the cover can be easily fixed to the housing via the open mouth. On the internal surface of the housing is provided reducing holes, with this structure, the cover can be firmly positioned after being assembled in the housing.
